Abstract

Introduction: Astrologers assume that the sun sign dictates personality. A relationship between personality traits and sun signs exists, though a degree of relation could vary. Selecting a career is thought to be dependent on a number of factors and the perceived suitability of one's personality characteristics to a certain career is one among other factors. **Aim:** The aim of the study was to explore zodiac signs and related personality traits of dental students and their perception toward dental specialties. **Methodology:** A cross-sectional study was carried out among ($n = 447$) undergraduates and postgraduate dental students in Andhra Pradesh. A pretested 3 questionnaire was used to collect data regarding demographics, education level, zodiac-related personality traits, and preferred dental specialty, which was assessed using Google Forms. A Chi-square test was done to know the association. **Results:** There is a statistical significance (<0.001) between the zodiac sign and the dental specialty they prefer. Majority of extroverts preferred surgery and conservative, while introverts chose pedodontics and periodontics. Ambiverts chose orthodontics and public health dentistry. **Conclusion:** Different personality types choose different specialties. There might be connections to zodiac signs that demand further research.

Keywords: Astrology, dental specialty, personality traits, zodiac signs

INTRODUCTION

The study of how the stars and planets move and are positioned in relation to human affairs and events are known as astrology.^[1] Astrologers believe that ancient people discovered subtle links between the planets and human life on Earth, allowing them to make accurate statements about life by knowing the positions of the planets. Many astrological theories claim a link between zodiac signs and human behavior, with the sun sign influencing one's personality and the moon sign influencing one's mentality. One of the factors is the perceived suitability of one's personality characteristics to a particular career.^[1] The growing awareness of dental education among the Indian population has raised their expectations of dental practitioners, and many patients would rather consult a specialist than an undergraduate. Social standing and high professional status are just two factors that impact how students decide on their major specialty.^[2] If the described personality traits assigned to each zodiac sign are true, then choosing a career should not be surprising, as there is evidence in clinical medicine with a link between zodiac signs and different specialties. Hence, the researchers attempted to investigate the relationship between

astrological signs and specialties as an example, with the goal of determining how applicable the zodiac personality traits are to participants based on their sun signs and whether there is a link between the zodiac sign and the specialty career they prefer.

METHODOLOGY

All undergraduate and postgraduate dental students who were enrolled in Andhra Pradesh dental colleges at the time were the study population of this cross-sectional study. The sampling method is convenience sampling, and the sample is precision based.^[3] Institutional review board approval was granted. A self-administered, pretested branching and logical questionnaire was distributed through Google Forms, which remained open for approximately 4 weeks from July to August 2022. The majority of the questions focused on their zodiac sun sign, self-reported personality traits,^[4] and

specialty preferences. Data were collected using Google Forms and then transferred to the Statistical Package for the Social Sciences (SPSS) V.29.0 (IBM CORP) (Statistical data 2022 SPSS, Inc., an IBM company, Chicago, Illinois, USA version 29.0). for statistical analysis using the Chi-square test. This questionnaire was tested in a pilot study before the study in a dental college in Andhra Pradesh, to check the validity of the questionnaire. The results of the pilot study showed acceptable validity with Cronbach's $\alpha = 0.89$. This study involved 40 dentists. The questionnaire was then revised, with minor changes to the questions and format made for the final draft, which could be completed in 5–10 min, according to the pilot study. The participants were asked to fill out and submit the Form online.

RESULTS

Demographics

Descriptive statistics were used to represent the demographic data. A total of 447 responses were recorded over the 4-week study period. There was female predominance (84.8%) when compared to males (15.2%). The mean age of the respondents was 22 ± 3.5 years. The highest responses were received from Leos (11.9%) and the lowest from Aquarians (4.5%).

Personality traits

About 49.5% of the respondents considered themselves extroverts, 34.4% as introverts, and 16% as ambiverts. The majority of the participants readily accepted personality traits that were preassigned to each zodiac sign [Table 1]. This could be due to the “Barnum effect.” The signs of the zodiac with the highest percentage of extroverts were Scorpio and Leo signs. Introverts were Cancer and Virgo sun signs. Ambiverts were Capricorns and Aquarians [Table 2].

First preference-dental specialty

The Chi-square test was done to know the association between preferred dental specialty and zodiac sign. The

significance ($P < 0.001$) of each Zodiac's preference for a dental specialty is shown by the results [Figure 1]. About 33.6% of Capricorn participants preferred public health dentistry and 42.9% of Sagittarians. 28.6% of Aquarians preferred orthodontics. 66.7% of Scorpions preferred prosthodontics. 80% of Aries preferred conservative dentistry. 56.6% of Gemini, 42.2% of Leos, and 45.4% of Virgos preferred oral surgery. 80% of Taurus-signed individuals preferred pedodontics, along with 50% of Cancerians. 55% of Pisceans preferred periodontics [Figure 1], which was statistically significant (<0.001). The majority of extroverts chose oral surgery and conservative. Ambiverts chose public health dentistry and orthodontics. Introverts chose periodontics and pedodontics [Figure 2].

Reason for choosing postgraduation

Overall, participants (68%) opted for “opportunities for self-employment” as the major reason for choosing postgraduation [Figure 3], of which the majority were Scorpio sign participants, and the least responded reason was “taking up postgraduation if the seat is allotted to them” (4%) opted by Virgo and Sagittarians.

Table 1: Zodiac signs and self-reported personality traits

ZODIAC SIGNS	PERSONALITY TRAITS
Aries	Passionate, Turbulent, Impulsive
Taurus	Practical, Passive, Materialistic
Gemini	Versatile, Frank, Curious
Cancer	Moody, Shy, Warm
Leo	Generous, Cheerful, Loyal
Virgo	Perfectionist, Organised, Meticulous
Libra	Tactful, Peaceful, Easy going
Scorpio	Strong-willed, Fundamental, Secretive
Sagittarius	Enthusiastic, Impatient, Idealistic
Capricorn	Ambitious, Reliable, Formal
Aquarius	Original, Reserved, Inflexible
Pisces	Helpful, Sensitive, Dreamy

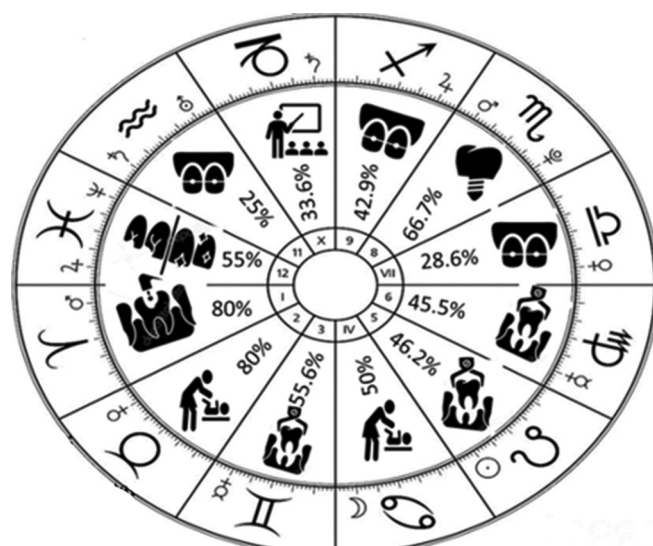

Figure 1: Most preferred dental specialty in each zodiac sign

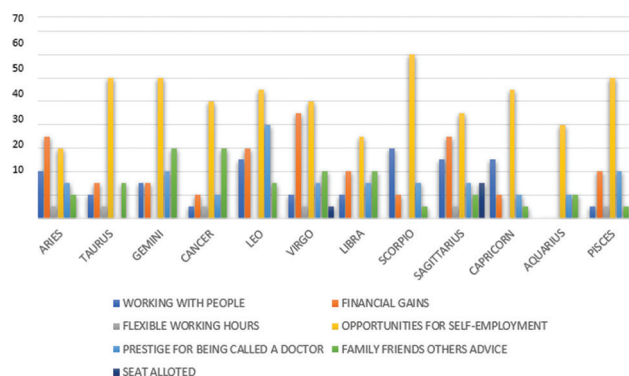

Figure 2: Most preferred specialty based on personality

Table 2: The number and percentage of participants based on their gender and zodiac sign

Variable	Category	n (%)
Gender	Male	68 (15.2)
	Female	379 (84.8)
Zodiac signs	Aries	33 (7.4)
	Taurus	33 (7.4)
	Gemini	41 (9.0)
	Cancer	39 (8.7)
	Leo	53 (11.9)
	Virgo	45 (10.1)
	Libra	33 (7.4)
	Scorpio	31 (6.9)
	Sagittarius	49 (11.0)
	Capricorn	29 (6.5)
	Aquarius	20 (4.5)
	Pisces	41 (9.2)

DISCUSSION

Hindu astrology is a form of divination that is also fundamental to Indian culture's spirituality and cultural traditions. One of the great seven sages known as the "Father of Hindu astrology" is Maharshi Bhrigu, who wrote the first Vedic astrological work, the Bhrigu Samhita. The Vedanga Jyotisha, compiled by Lagadha Muni in 1400 B. C., is regarded as the foundational work of Indian astronomy and astrology.^[5] The likelihood of receiving a good education depends on the timing and placement of the stars and planets at a specific time. Through astrology, scopes, and future educational planning can be predetermined. In India, only a few seats are available for postgraduate studies in dentistry.^[6] As the number of undergraduate dental seats increases, so does the demand for specialty training.^[7] Individual preferences toward various specialties in dentistry can be useful in identifying individual choices.^[5] There is a link between personality traits and sun signs. Personality traits have a significant impact on career choice, even though it is influenced by a variety of factors. Personality is the set of characteristics that distinguishes an individual. Mayo, White, and Eysneck reported positive results involving a marginal relationship between the zodiac sign introversion and extraversion variables. Introversion and extraversion are psychological constructs that are still used in modern personality tests. Carl Jung popularized the concept of these psychological traits in his influential book "Psychological Types" in 1923.^[8] Later, in 1947, psychologist Hans Eysenck proposed ambivert as a personality trait that falls between the extrovert and introvert spectrums.^[9] Aries, Gemini, Leo, Libra, and Sagittarius are the six extrovert signs, while Taurus, Cancer, Virgo, Scorpio, Capricorn, and Pisces are the six introvert signs. People pursue various careers for a variety of reasons. Professional motivating factors are classified into four categories in the psychology literature: (1) prosocial, (2) external, (3) intrinsic, and (4) loafing.^[2] Holly Morgan from the United Kingdom conducted a similar study on

**Figure 3: Reason for choosing post graduation**

medical specialties in 2020.^[1] Sievert *et al.* proposed that personality-related factors motivated people to pursue careers in medical specialties.^[10] This is the first study to examine the relationship between zodiac signs and dental careers. There is statistical significance between zodiac signs and preferred dental specialty, and the findings of this study are consistent with the findings of Holly Morgan's study. The percentages of introverts, extroverts, and ambiverts in each zodiac sign did not differ significantly from one another. Similar to the findings of Ravi *et al.* and Garla *et al.*, oral surgery was the most preferred specialty in the current study.^[11,12] A large-scale study evaluating the relationships between zodiac signs and medical specialties, revealed associations between the two, which support earlier research. The results of the study conducted by Cao Huizi demonstrate that participants will perform poorly when trying to match their zodiac sign with descriptions that are vague and general, in line with the Barnum effect.^[13] In contrary to the results by Kapoor, 68% of the participants opted for "opportunities for self-employment" as a reason for opting for postgraduation.^[14] However, results regarding gender were in accordance with those reported by Kapoor *et al.*, representing the feminization of the profession.^[14] Irrespective of their zodiac signs, the most preferred specialty was oral surgery, followed by conservative. Oral pathology and oral medicine were found to be the least preferred specialty. Surprisingly, only 7.1% of current postgraduates and 4.5% of undergraduates preferred public health dentistry as their first choice. This study's primary drawback is that it was only conducted in one state, which may not fairly represent all students nationwide. In addition, though the process is less time-consuming, the results obtained using these methods may be fairly accurate.

CONCLUSION

Particularly when forming teams, knowing your people's personalities at the workplace can help you better understand how they function and how you can collaborate with them. Individuals make up a team, and personality can be either the mortar or the chisel that keeps the team together. Trends between specialties and zodiac signs are evident, but larger numbers per zodiac and specialty group are needed to show accuracy. At least temporarily,

the zodiac sign's impact on career choices seems to be a "pseudoscience." Astrology continues to be a theory with a set of hypotheses that require rigorous and systematic investigation, and it can be compared to other theories of human behavior. Unfortunately, many studies have proven to be scientifically useless, and many people do not believe in astrological theories, but there is also superstition, in avoiding superstition.
